AN:  PAT 1986-000432
TI:  Transmitting plesiochronous data in PCM system using data
     frame divided and assigned for max. channel usage
PN:  DD227019-A
PD:  04.09.1985
AB:  A data frame comprising a given number of frames is formed.
     From the channel interval that has no frame sync. signal, one
     of the last four bits are used for sending the extra signal,
     such as pulse stuffing and octet information. The data frame is
     divided into sixteen time intervals, the first and ninth of
     which are used for sync. and stuffing/ octet.; More effective
     use of channel capacity.
